Abstract of the Disclosure

An optical signal performance monitoring apparatus in a multi-channel optical transmission system and a method for monitoring the optical signal performance, are provided. To achieve the above objective, the The optical signal performance monitoring apparatus in the multi-channel optical transmission system includes an optical input unit for controlling the spot size of an inputted multi-channel optical signal and generating a 1st multi-channel beam; a diffraction and reflection unit for diffracting and reflecting the 1st multi-channel beam; and generating a 2nd multi-channel beam which is divided by wavelength and is in parallel with the 1st multi-channel beam; an optical collimation and concentration unit for collimating the 1st multi-channel beam and concentrating the 2nd multi-channel beam which is divided by wavelength: and an optical detection unit for measuring the intensity of the 2nd multi-channel beam focused by wavelength, and measuring the optical signal-to-noise ratio by measuring the optical intensity corresponding to each wavelength and an amplified spontaneous emission (ASE) noise strength at a point between optical signals.

; an optical input unit for controlling the spot size of an inputted multi-channel optical signal and generating the 1st-multi-channel beam; an optical collimation and focusing unit for collimating the 1st-multi-channel beam and focusing the 2nd-multi-channel beam which is divided by wavelength; a diffraction and reflection unit for diffracting and reflecting the 1st collimated multi-channel beam, and generating the 2nd-multi-channel beam which is divided by

wavelength and is in parallel with the 1st collimated multi-channel beam; an optical detection unit for measuring the intensity of the 2nd multi-channel beam by wavelength, which is focused by wavelength by the optical collimation and focusing unit. The optical signal performance monitoring apparatus can measure the intensity, the wavelength and the optical signal to noise ratio of the multi-channel optical signal by channel simultaneously in real time. In addition, since the optical signal performance monitoring can minimize the impact caused by an aberration and maintain the same f-number in the optical system, a high resolving power and a high dynamic range are guaranteed.
